The present invention relates to a semiconductor integrated circuit device and a method of manufacturing the same, and particularly to a technique applicable effectively to an electric power device in which an internal electrode is formed inside a semiconductor substrate. In recent years, the operation of a voltage-driven semiconductor element represented by a thyristor and the like has become faster. A metal oxide semiconductor field effect transistor (MOSFET) is one of switching devices which are installed in the electric power device. A MOSFET needs such a gate insulating film for making an electric charge accumulated in a gate electrode function as an insulating film for permitting a flow of an electric current. The gate insulating film may be formed through thermal oxidation of a semiconductor substrate after introducing doping of a Group V element such as phosphorous, arsenic or boron.
