In the call, de Blasio promised New Yorkers that "the city is going to take care of you." He said there was no immediate threat to the city's residents and it was too early to speculate on the cause of the blast that damaged two of the 4,000-plus miles of track, which carry some 260,000 commuters daily. The blast injured more than a dozen people and caused a "sudden and violent shutdown" of the New York City subway system, de Blasio said. He added the government was working "aggressively" to reopen the tunnels and ensure New Yorkers could get home and to their jobs. The city later released the transcript of the call, which was made to a Department of Sanitation employee who then relayed the information to de Blasio. "All this is under control. We are going to reopen these tunnels as soon as we can," de Blasio said. The caller told the mayor that the first responders "are here with you, and we're here with you." "You're going to have more backup, and we're going to do everything we can to get people home, get people to their jobs as soon as possible," the caller said. De Blasio told the caller: "We got it, thank you, you're doing great, you're doing great, we appreciate your help, we got it." The blast took place around 6:15 a.m. on Saturday. Among the injured were two firefighters who responded to the incident, and three police officers who were near the site at the time, New York Fire Department officials said. An international team of astronomers has uncovered evidence for four new planets in the system that is home to the unusual white dwarf star, named LSPM J1112+7626. The new planets are much smaller than Neptune or even Earth, and a few are likely to be habitable. One of the new planets, called LSPM J1112+7626 b, is in the “habitable zone,” and may be rocky or a gas giant. For a planet to be considered habitable, it must be located between its star and the planetary boundary, called the “habitable zone.” This zone is typically defined as the area around a star where liquid water can exist on the surface of a planet. In the case of LSPM J1112+7626 b, the planet is likely to be inside the habitable zone. Another planet in the system, called LSPM J1112+7626 c, is in a zone where liquid water may exist, and could be covered in ice or even a gas giant. This planet is between the habitable zone and the planetary boundary. LSPM J1112+7626 d is the furthest from its star of the four planets. It is the coldest planet in the system, and is probably a
