Data types, their features, and how they are used In AutoCAD, everything is a data type. (In fact, everything is a type of data, including the empty space or absence of a type.) AutoCAD automatically sorts data according to its type. You can also create a class of data types and group them together. You can add a custom attribute to each group that allows you to identify them. There are many data types in AutoCAD, including: * The Boolean data type, also known as the logical data type. You can use it to store information such as Yes/No or true/false. * The text data type. This data type can store any string of characters. A text data type is often used to store information such as names, addresses, or phone numbers. * The numeral data type. This data type is used to store numbers such as percentages or decimals. * The interval data type. This data type is used to store times such as numbers of seconds, minutes, hours, or days. * The user data type. You can use this data type to store any information that you want to keep private.
