The present invention relates to an antenna for receiving or transmitting radiation, in particular, a radio-frequency antenna, for use in mobile radio devices, e.g. mobile telephones or radio-frequency identification tags. For the reception or transmission of radio waves, different types of antenna are known, among which there are, e.g., built-in antenna, above-glass antennas and external antennas. Built-in antennas are integrated within the body of a mobile radio device, e.g., a mobile telephone, such that they are not visible from the outside. Above-glass antennas are mounted on a vehicle windscreen, wherein the distance from the glass pane and the radiation connection can be critical. The above-glass antennas have the disadvantage that they are visible from the outside. External antennas are located outside of the body of a mobile radio device and, in this case, must be coupled with a coupling element, which is, e.g., a rod antenna. The external antenna is tuned to the reception band or to the transmission band by a suitable tuning or fine-tuning element, so that a maximum coupling efficiency can be achieved.
