C1240 k9w 7 tar 124 25d Ja2 tar hit.As the number of people connecting to the Internet continues to increase, so do the number of people connecting their personal computers to the Internet in order to send, access and retrieve information. For a customer to gain access to the Internet, the customer has to execute a number of steps. First, the customer must connect the customer's personal computer to an external access point, such as a telephone line or cable television system, to receive service from a service provider. Once connected to the external access point, the customer must then enter an access code or dial a designated access number or access code to access the service provider's system or network. For a customer to access the Internet, the customer must also execute a series of further steps. To access the Internet, the customer must determine the Internet Protocol (IP) address of a predetermined Internet service provider (ISP). To be able to access the ISP's system, the customer must input the appropriate IP address and at least one of the computer user's name or user ID in an appropriate field or location on an ISP home page. Additionally, many ISPs, especially very large ISPs, utilize a security or authentication feature to verify the identity of the user seeking access to the ISP's system. To access the ISP's security feature, the user must also input a password or other security authentication code. After the customer is connected to the ISP's security system, the customer must find the appropriate page to be retrieved by accessing the ISP's home page. To find the appropriate page, the customer must either know the corresponding Universal Resource Locator (URL) or use a search engine provided by the ISP to identify the URL of the desired page. Once the appropriate page is identified, the customer must enter the URL in a "linking edd6d56e20
