In the late 1990s, it was standardized by Autodesk as part of the AutoLISP (Auto CAD Lisp) API. AutoLISP is still used by customers to add custom functionality to AutoCAD. AutoLISP is also supported by almost all of the above programs. For a discussion on the history of LISP in AutoCAD, see the references section of the article on Autodesk LISP. History AutoCAD was originally created as an on-line documentation system for the Autodesk computer-aided design (CAD) product. The original code was written by Andrew E. Hart in 1986 to support a simple documentation database. An earlier version, named CADDOC, was released in 1980 to support the Avery Design Systems D+ graphics software. The CADDOC software was written in Common Lisp and was available as a package from MIT. It was also the basis of the start-up company LaserSoft which was later acquired by Bentley Systems. The CADDOC software ran on the DEC VAX and VAXStation computers. The software was originally developed for the Topographica series of Cadastral Mapping software and was used to manage geographical data sets with reference to map projections. Topographica Map software ran on the DEC VAX-11 minicomputer. This software package included the ability to edit topographic maps and overlay data sets on the maps. The first CAD program to include the ability to edit drawings, was AutoCAD 1985. Originally, users could edit the drawings and import them into the CAD database, but not edit the database itself. The first version of AutoCAD did not have all the features of the later versions, nor did it incorporate all the later functionality. It is the first software to incorporate a function based programming language. The developers at Autodesk used the Common Lisp programming language for the CAD database to allow a rapid application development (RAD) environment to be developed for the first version of AutoCAD. The language was chosen because it was easy to learn and taught users to think in a functional way. The first release of AutoCAD was only able to import DXF files, as well as open and save files. The export features were very primitive and only exported polygons. The features, including export functions, were further developed in version 2. AutoCAD was originally written in a new programming language, called AutoLISP. This language is based on af5dca3d97

In recent years, a wireless communication technology known as Long Term Evolution (LTE) has become one of promising technologies in a mobile communication system, and the LTE is now being standardized by the 3rd Generation Partnership Project (3GPP). In addition, wireless communication devices such as mobile phones have become ubiquitous, and a demand for improved communication capacity is continuously increasing. Thus, there is an increasing demand for a further improved technology. Patent Document 1 describes a communication system including a plurality of base stations, a communication terminal which communicates with each base station and a communication control device which controls the base station. The communication control device receives a communication method with the highest communication quality and performs communication according to the communication method. Patent Document 2 describes a method for setting information of a communication environment in a base station. In this method, the base station receives channel information from a communication terminal, and determines the communication method to be used according to the channel information.
