[Vascularized fibula bone transplantation for the treatment of bone defects after the osteo-synthesis of tibial plateau]. Our study is a retrospective analysis of 9 cases of vascularized fibula bone transplantation with a modified method, without a microvascular anastomosis, for bone defects around the knee after the osteo-synthesis of tibial plateau, with a follow-up of 3-10 years. All the wounds were closed after the operation. One patient died of a lung infection after 3 years. The remaining 8 patients got a satisfactory and solid bony union of the host bone, with no recurrence of infection, and satisfactory knee movement at the last follow-up. The vascularized fibula bone transplantation is a simple, economic and effective treatment for the bone defects around the knee after the osteo-synthesis of tibial plateau, it is worthy of clinical attention.
